

1. Title

toothpaste.cv

Know when your smile needs a closer look.

A 2-minute AI visual oral health screening.

Hackathon pitch

2. Problem

People notice small dental concerns early,
but ignore them until pain forces a visit.

Common gaps:

- Is this stain / chip / gum change serious?
- Should I see a dentist now, or wait?
- No easy way to get a first visual read at home.

Result: delayed care and weaker dentist conversations.

3. Solution

toothpaste.cv turns guided oral photos into a clear visual screening report.

What it does:

- Guides users through 5 oral photo angles
- Reviews visible surface-level concerns with AI
- Explains what to watch and when to see a dentist

Not a diagnosis. Early awareness + triage.

4. How it works

1. Start with a concern
2. Take 5 guided photos
Front bite, left/right sides, upper arch, lower arch
3. AI reviews the images against a fixed oral rubric
4. Get a plain-English report with severity + evidence
5. Save, track over time, and bring it to a dentist

5. What we check

Nine visual screening areas:

1. Crowding & alignment
2. Tooth wear
3. Discoloration & staining
4. Gum health
5. Plaque & tartar buildup
6. Bite alignment
7. Spacing & gaps
8. Chips & fractures
9. Possible decay (visual flags only)

6. Product flow

Homepage -> Capture -> Analysis -> Report -> Timeline

Capture: guided framing cues for each view

Report: findings, severity, photo evidence, next step

Timeline: compare screenings over time

Output is dentist-ready language, not a medical claim.

7. Why it matters

For users:

- Faster first signal when something looks off
- Clearer questions for dental visits
- Habit of tracking visible changes

For the pitch:

- Real product, end-to-end flow
- Practical healthtech with strong demo potential
- Clear boundary: triage, not treatment

8. Trust & boundaries

What toothpaste.cv provides:

- Preliminary visual screening of outer enamel / smile
- Flags that may deserve clinical consultation
- Tracking of visible staining and alignment shifts

What still needs a dentist:

- X-rays, pocket depth, root issues, treatment plans

Privacy: photos stay in-session; no permanent photo storage for the free screening flow.

9. Who it's for

Primary users:

- People delaying dental visits
- Anyone unsure if a visible change matters
- Users preparing for a dentist appointment

Positioning:

Pre-visit visual triage tool.

Not a clinic replacement. A smarter first step.

10. Ask / close

Know when your smile needs a closer look.

Demo: live guided photos -> screening report

Next:

- Polish capture accuracy
- Stronger report UX
- Broader testing and feedback

Try toothpaste.cv

Thank you.
